1 Introduction

The Axon Admin Dashboard is the web console for the Axon conversational banking assistant. It gives your team one place to see how customers use the assistant, how well it performs, and to manage the institutions, languages, messages and settings behind it.

Monitor

Track audience growth, conversation volume, banking journeys, AI quality, response speed and system activity, each compared with the previous period.

Manage

Maintain institutions and licenses, dashboard users, assistant settings, reference data, message templates, conversation flows, languages and FAQs.

Who this guide is for

Dashboard accounts have one of three roles: **Super Admin**, **Manager** or **Viewer**. This guide is written for all three. Viewers will mostly use the Dashboard and Analytics sections; administrators also use the management modules in chapter 5.

Where the data comes from

Every figure on screen is loaded live from the Axon Admin API. The dashboard never calculates comparisons itself: the API supplies each value, its previous value, the percentage change and the explanation behind it. Refresh a page at any time to load the latest figures.

Your first five minutes

1 **Sign in**
Use the credentials from your administrator.

2 **Read the Dashboard**
Scan the headline cards and their change badges.

3 **Set the period**
Pick Today, Last 7 days or a custom range.

4 **Open Analytics**
Move across the six tabs for detail.

5 **Press ⓘ**
Read what any number means and how it is calculated.

ABOUT THE SCREENSHOTS

Screenshots were captured from a live Axon environment. Analytics figures cover the **last 7 days** unless a page says otherwise. Personal details such as email addresses and institution identifiers are blurred, and your own data will of course differ.

2 Getting started

2.1 Signing in

Open the dashboard address provided by your administrator and sign in with your username and password. If you have forgotten your password, use **Forgot password** on the sign-in page; a single-use reset link lets you choose a new one. Sessions expire after a period of inactivity, in which case you are returned to the sign-in page.

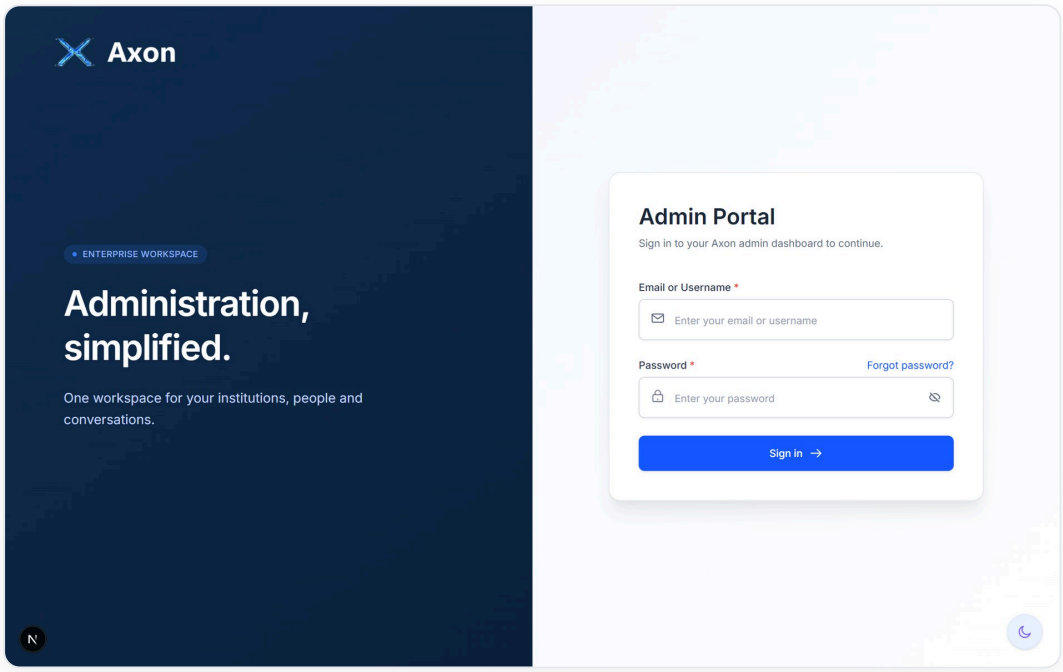

Figure 1. The sign-in page.

2.2 Finding your way around

The left sidebar groups every page. Use the round arrow on its edge to collapse or expand it.

Group	Pages
Overview	Dashboard, Analytics, Institutions, Logs
Administration	Dashboard Users, Configurations, Master Data, Messages, Flows, Languages, FAQs
Account	User Profile

The top bar contains the breadcrumb trail, a global search (press `Ctrl` + `K` from anywhere), the light/dark theme switch and your account menu. Each page also shows when it was **Last Updated** with a blue refresh button beside it.

2.3 Light, dark and mobile

The dashboard follows your preference for light or dark appearance and can be switched at any time with the moon icon. It is fully responsive: on a phone the sidebar becomes a slide-out menu and cards stack in a single column.

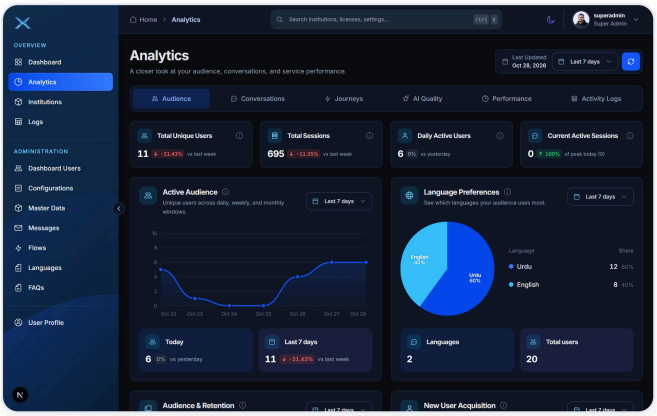

Figure 2. Dark theme.

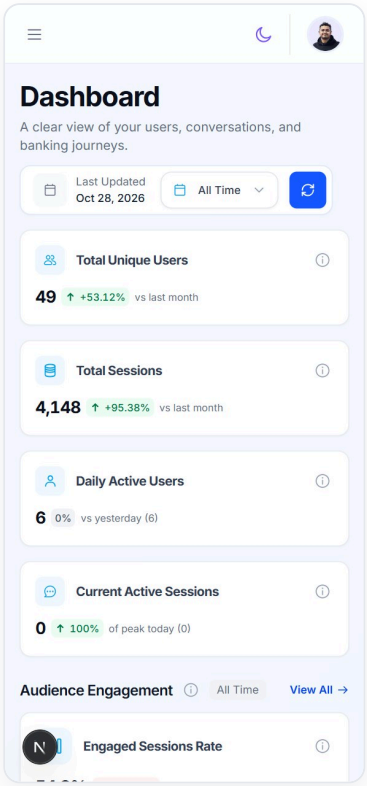

Figure 3. Mobile layout.

3 The Dashboard

The Dashboard is the first page after sign-in. It answers three questions at a glance: *who is using the assistant, how engaged are they, and are banking tasks being completed?* Use the period selector beside **Last Updated** to change the reporting window, and **View All** on a section to open the matching Analytics tab.

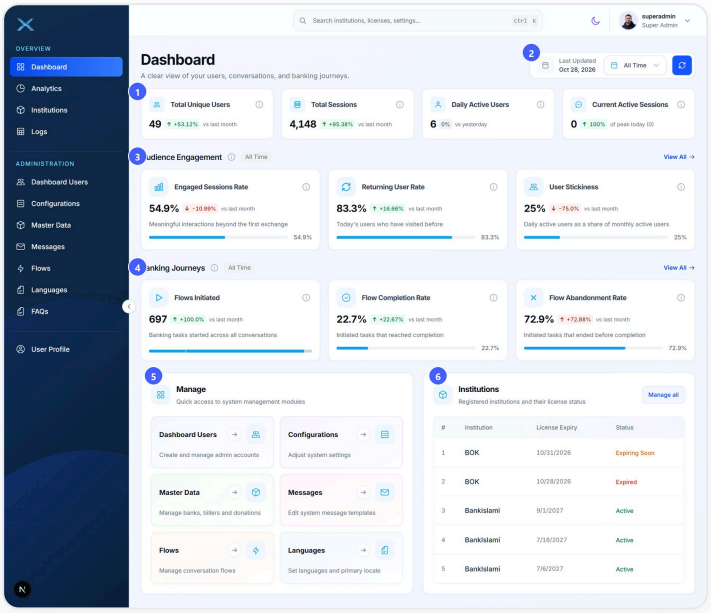

Figure 4. The Dashboard.

1. **Headline cards** with change badges
2. **Period selector** and refresh
3. **Audience Engagement**
4. **Banking Journeys**
5. **Manage** shortcuts
6. **Institutions** panel

Section	What it shows
Headline cards	Total Unique Users, Total Sessions, Daily Active Users and Current Active Sessions, each with its change against the previous period.
Audience Engagement	Engaged Sessions Rate, Returning User Rate and User Stickiness, with a progress bar for each percentage.
Banking Journeys	Flows Initiated, Flow Completion Rate and Flow Abandonment Rate. For abandonment, a decrease is good news and is shown in green.
Manage	Shortcut tiles to Dashboard Users, Configurations, Master Data, Messages, Flows and Languages.
Institutions	The most recently registered institutions with their license expiry and status. Choose **Manage all** to open the full list.

4 Analytics

Analytics gives a deeper view of the same data across six tabs. Switch between them with the tab bar under the page title.

Tab	Question it answers
Audience	Who is using the assistant, and do they come back?
Conversations	How much do customers talk to it, and when?
Journeys	Do customers finish the banking tasks they start?
AI Quality	Does the assistant understand requests, and stay safe?
Performance	How fast does it respond?
Activity Logs	Are interactions succeeding, and what is going wrong?

4.1 Reporting period

The period selector at the top right of the page controls every card on the tab. Choose a quick range such as **Today**, **Yesterday**, **Last 7 days** or **Last 30 days**, or pick a custom start and end date. Many cards also carry their own period button so you can compare windows side by side. While a panel is open the page behind it is softly blurred to keep your focus on the choice.

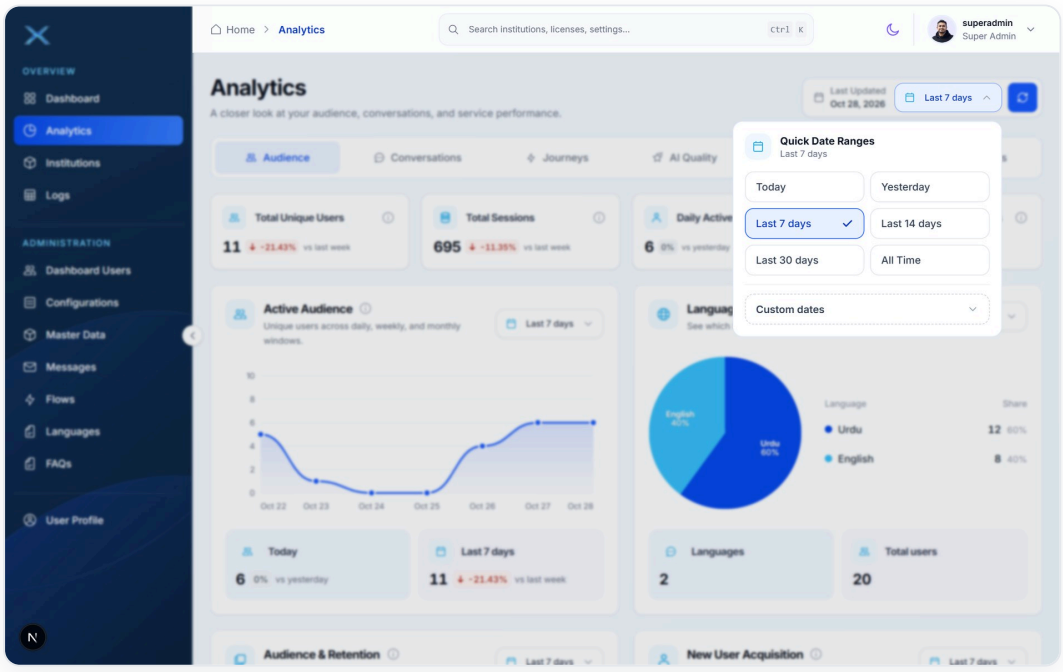

Figure 5. Choosing a reporting period.

4.2 Reading a metric card

Every headline card follows the same pattern: the figure, a coloured change badge, and the comparison it refers to (for example *vs last week*).

Badge	Meaning
▲ +13.6% green	A favourable change. For measures where lower is better, such as abandonment or latency, a decrease is shown in green.
▼ −21.4% red	An unfavourable change compared with the previous period.
0% grey	No change, or a figure that is shown for context only.

The ⓘ information button

Select or hover over the ⓘ beside a card title for a plain-language explanation: what the number means, the **formula** behind it and a worked **example**. The page dims and blurs while the explanation is open. Click the button to keep it open, and press `Esc` or click elsewhere to close it.

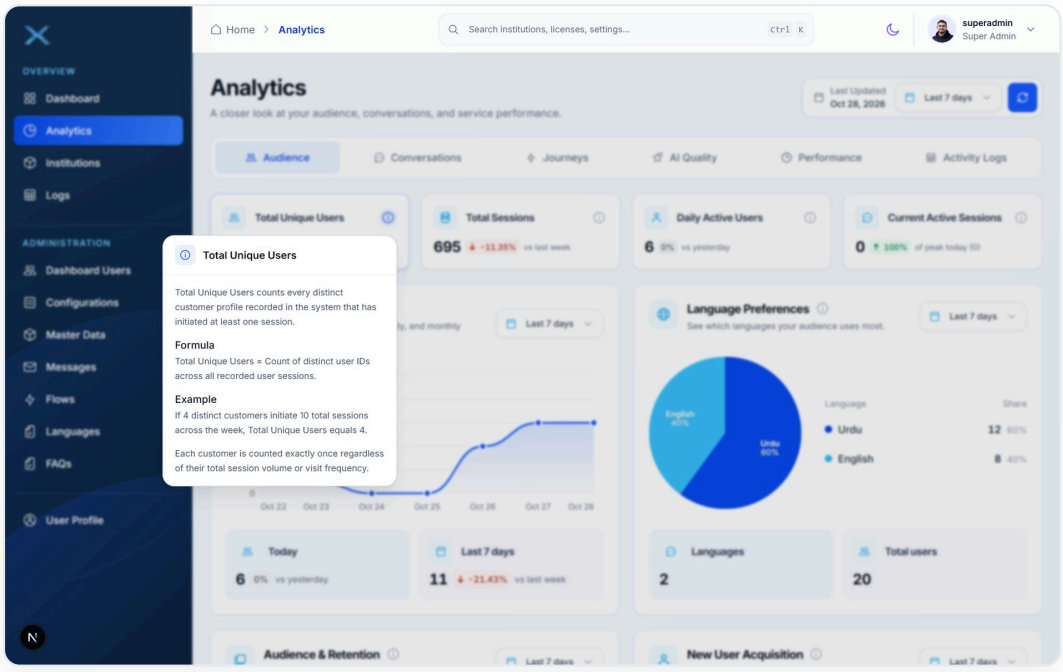

Figure 6. The explanation panel for Total Unique Users.

4.3 Audience

Understand your customer base and whether people return.

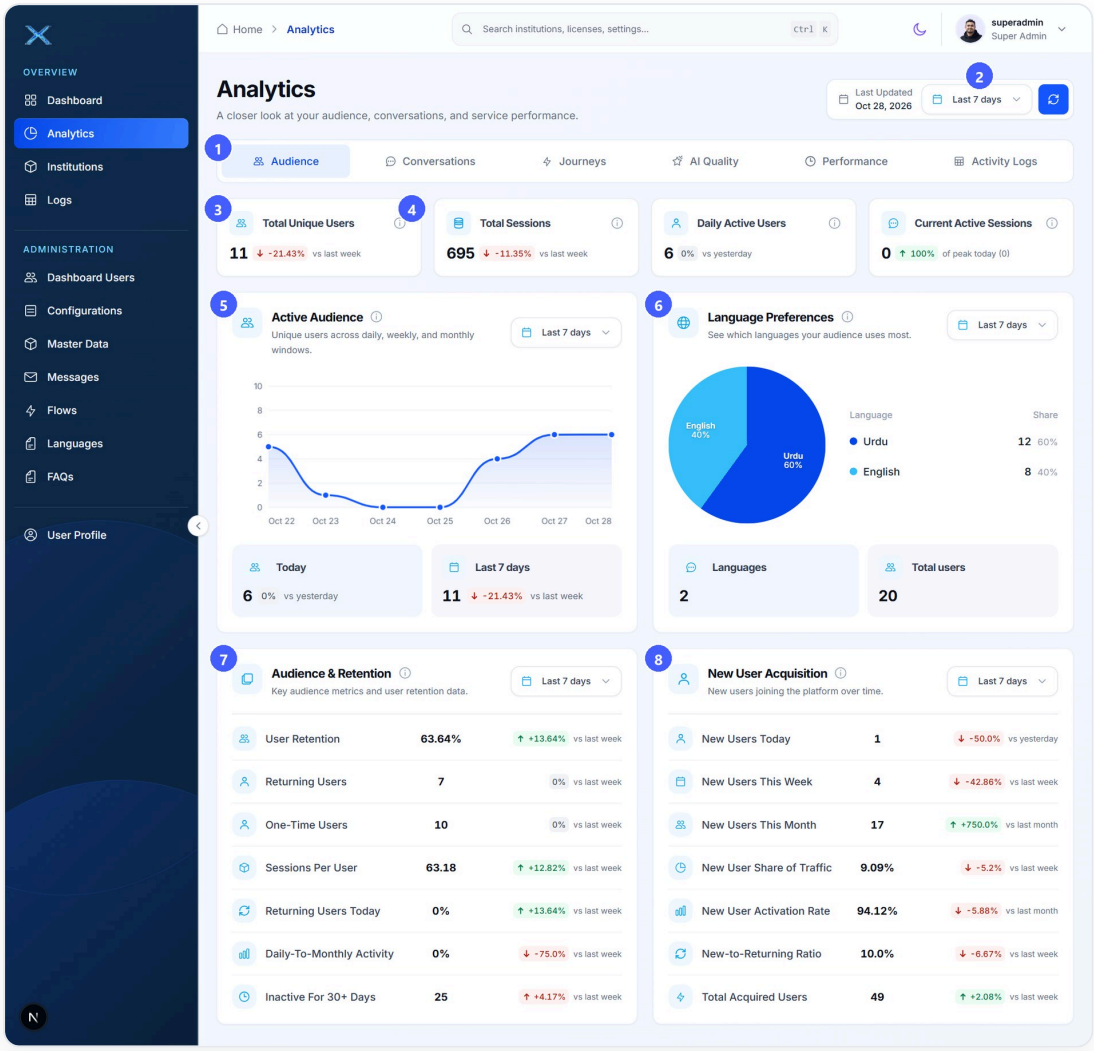

Figure 7. The Audience tab.

1. **Tab bar**: switch between Audience, Conversations, Journeys, AI Quality, Performance and Activity Logs.
2. **Reporting period**: the window every card on the tab reports on.
3. **Headline cards**: Total Unique Users, Total Sessions, Daily Active Users and Current Active Sessions.
4. ⓘ **button**: what the figure means, its formula and an example.
5. **Active Audience**: a daily activity curve with summary cards for today and the selected period.
6. **Language Preferences**: share of customers by preferred language, number of languages and total users.
7. **Audience & Retention**: retention, returning and one-time users, sessions per user, daily-to-monthly activity, and users inactive for 30+ days.
8. **New User Acquisition**: new users today, this week and this month, share of traffic, growth rates and single-session drop rate.

4.4 Conversations

See how much customers talk to the assistant and when they are busiest.

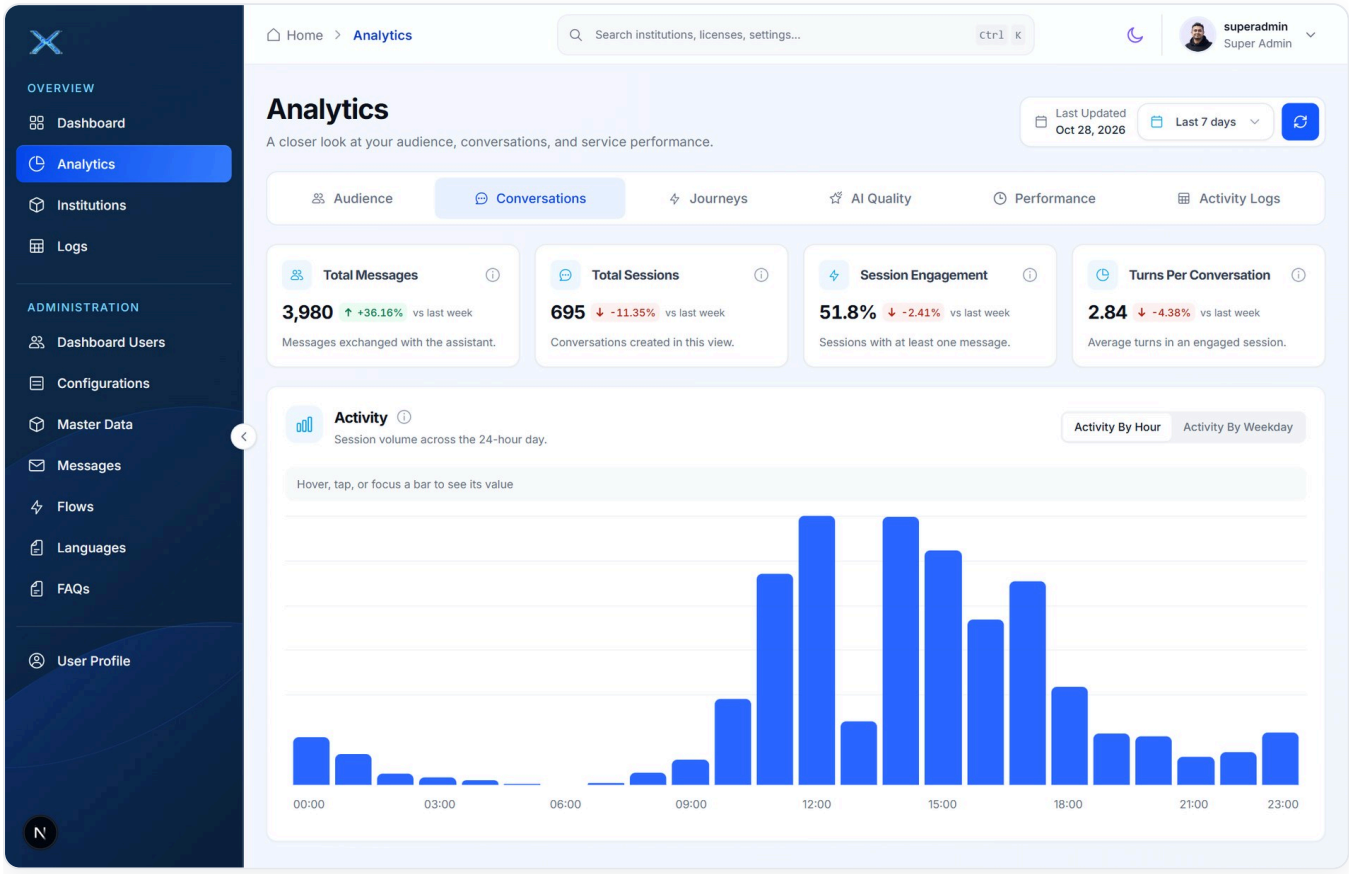

Figure 8. The Conversations tab.

- **Headline cards**: Total Messages, Total Sessions, Session Engagement and Turns Per Conversation.
- **Activity**: one card with a switch between **Activity By Hour** (to find peak hours) and **Activity By Weekday** (to find the busiest days).

> **TIP**
>
> Use the hourly view to plan support cover and maintenance windows: schedule changes in the quietest hours.

4.5 Journeys

A journey is a multi-step banking task such as a fund transfer, bill payment or adding a beneficiary. This tab shows how many start, finish or are abandoned.

Figure 9. The Journeys tab.

- **Headline cards**: Journeys Started, Journeys Completed, Completion Rate and Abandonment Rate.
- **Journey Trends**: started, completed and abandoned journeys over time.
- **Journeys By Category**: which banking tasks customers start most. **View all** lists every category.
- **Completion Vs Abandonment Rate**: for each category, the share finished against the share left unfinished. Categories with low completion are the best candidates for improvement.
- **Journey Outcomes Detail**: a searchable table with total, completed, cancelled, failed, abandoned, completion rate and average steps per journey.

4.6 AI Quality

Check that the assistant understands customers and keeps conversations safe.

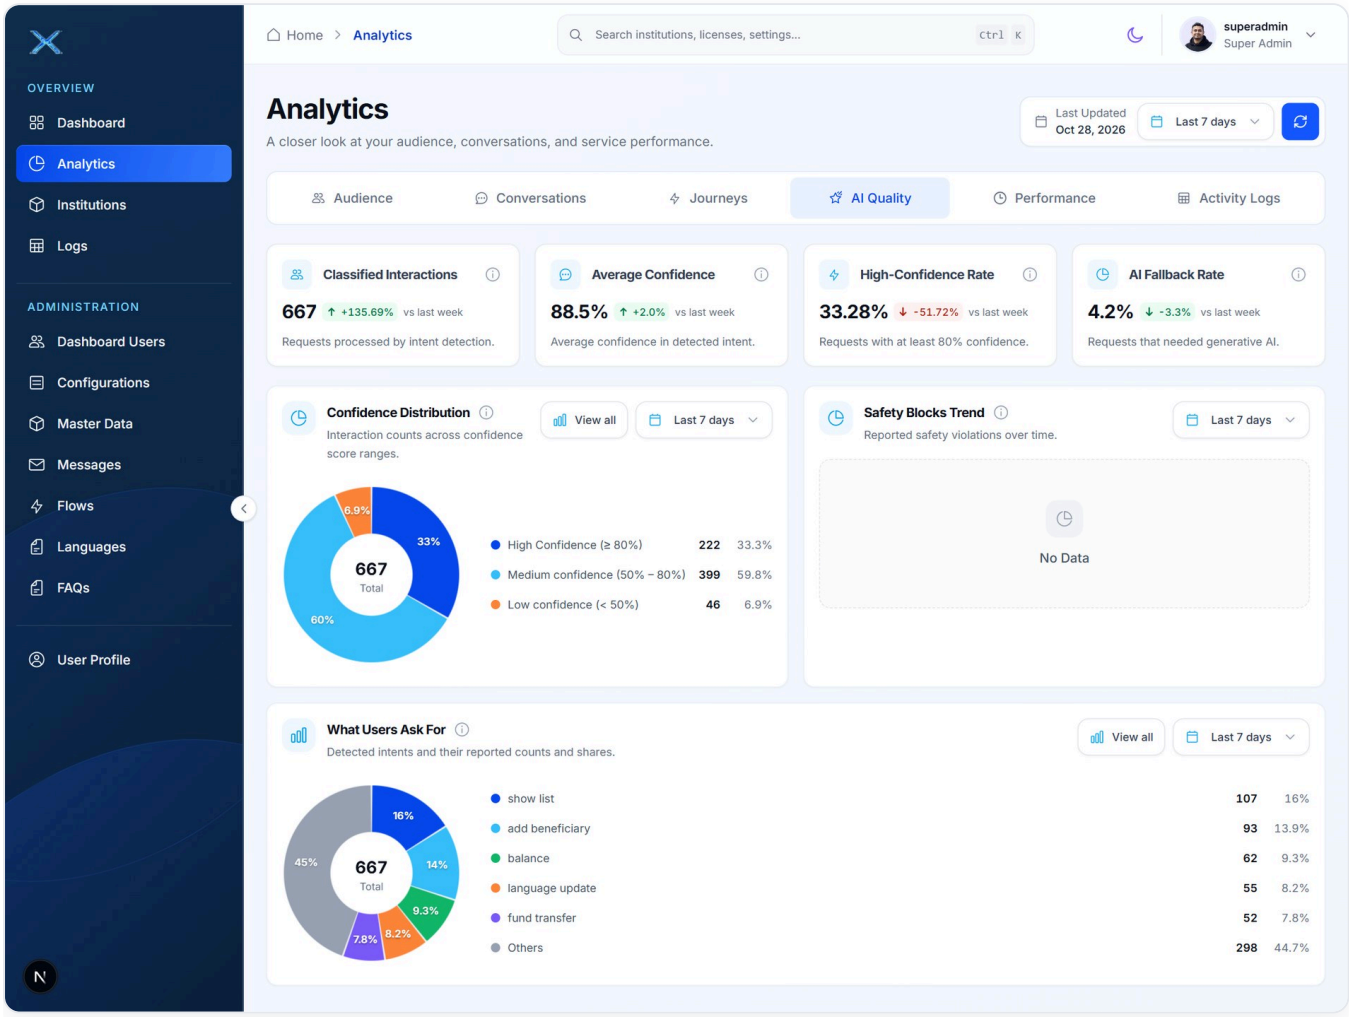

Figure 10. The AI Quality tab.

- **Headline cards**: Classified Interactions, Average Confidence, High-Confidence Rate and AI Fallback Rate.
- **Confidence Distribution**: the share of requests understood with high, medium or low confidence. A large low-confidence slice means requests are being misread.
- **Safety Blocks Trend**: how often safety checks blocked or flagged a message over time.
- **What Users Ask For**: the topics customers raise most often. **View all** lists every one.

A card reading **No Data** means nothing was recorded for the selected period. It does not indicate a fault.

4.7 Performance

Measure how quickly the assistant responds. For all speed measures, lower is better.

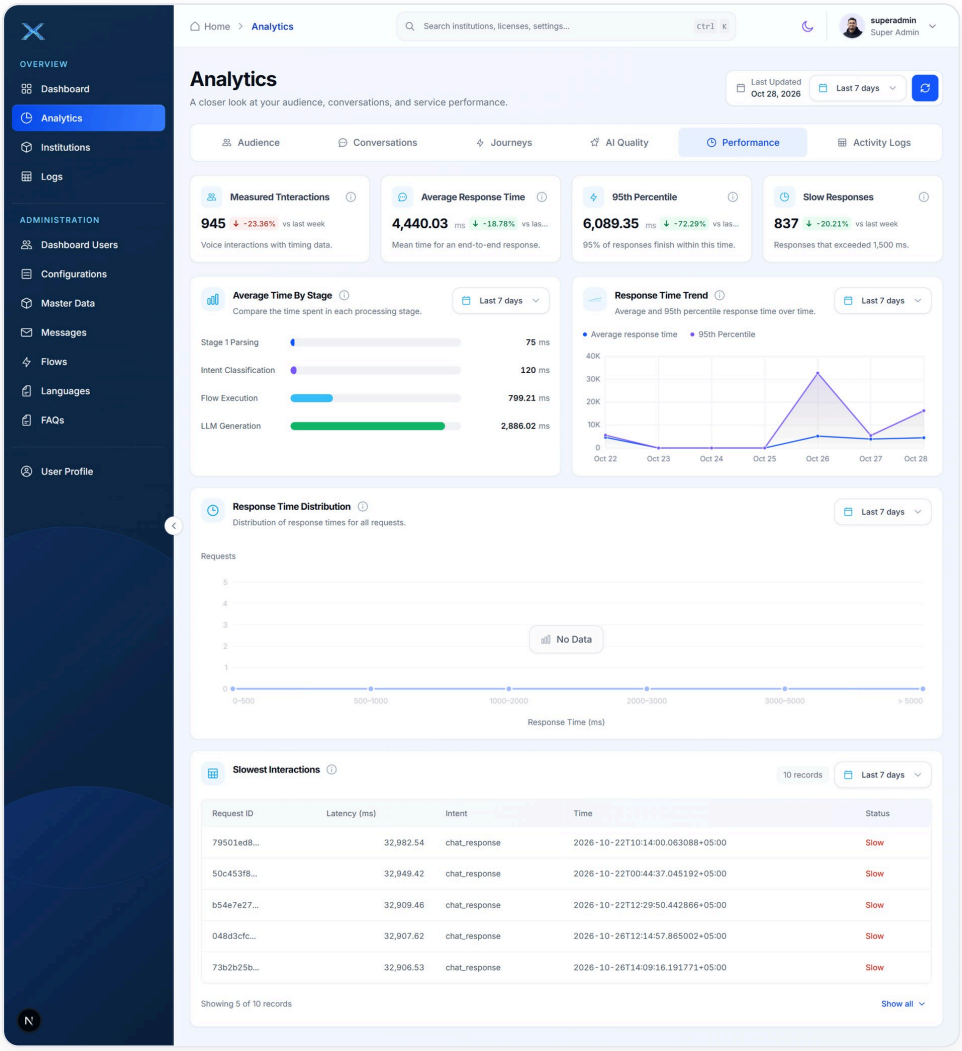

Figure 11. The Performance tab.

- **Headline cards**: Measured Interactions, Average Response Time, 95th Percentile and Slow Responses (over 1,500 ms).
- **Average Time By Stage**: where time is spent: parsing, intent classification, flow execution and AI generation.
- **Response Time Trend** and **Response Time Distribution**: how speed changes over time and how responses spread across fast and slow ranges.
- **Slowest Interactions**: the individual requests that took longest, for troubleshooting.

> **PERCENTILES EXPLAINED**
>
> The average hides slow outliers. **P50** is the typical response; **P95** is the time that 95% of responses beat. A large gap between them means some customers wait much longer than most.

4.8 Activity Logs

Review how interactions ended and where errors occur.

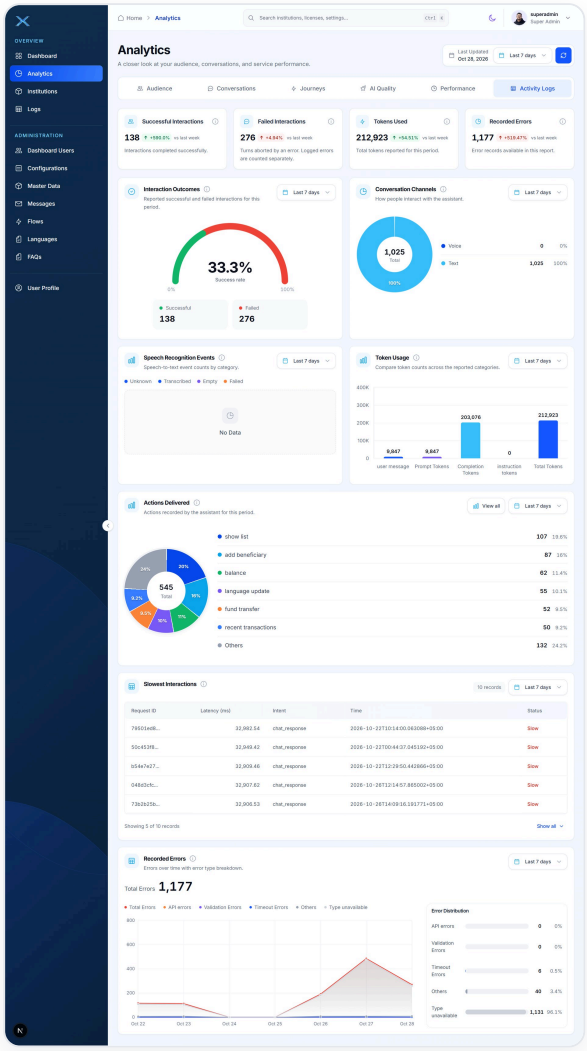

Figure 12. The Activity Logs tab.

- **Headline cards**: Successful Interactions, Failed Interactions, Tokens Used and Recorded Errors.
- **Interaction Outcomes**: a gauge of the success rate with successful and failed counts, beside **Conversation Channels** (voice versus text).
- **Speech Recognition Events** and **Token Usage**: how voice input was transcribed, and how many tokens were spent on prompts and completions.
- **Actions Delivered**: what the assistant did for customers, ranked by count.
- **Slowest Interactions** and **Recorded Errors**: the slow requests, and errors over time with a breakdown by type.

5 Administration modules

In this chapter Institutions, Logs, Dashboard Users, Configurations, Master Data, Messages, Flows, Languages, FAQs and User Profile. Step-by-step tasks follow in chapter 6.

The Administration group and the Institutions and Logs pages let authorised users manage the assistant. Most list pages share the same controls: a search box, filters, a **Rows per page** selector, page navigation and a primary action button at the top right.

5.1 Institutions

Register financial institutions, issue license keys and track subscription expiry. Summary cards show total, active, expiring-soon (within 30 days) and expired licenses. Use **New Institution** to add one; each row offers actions such as editing and renewing the license.

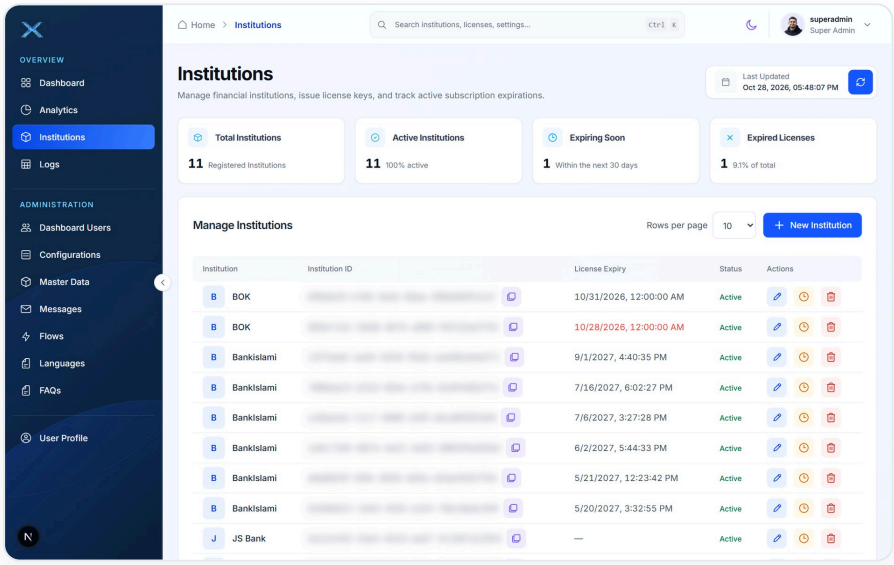

Figure 13. Institutions.

5.2 Logs

A live view of assistant activity. The session list on the left filters the stream to one conversation. **Real-Time** streams events as they happen; **History** searches past events. Use **Pause**, **Clear**, **Copy** and **Download** to work with the stream, and **Full screen** for more room.

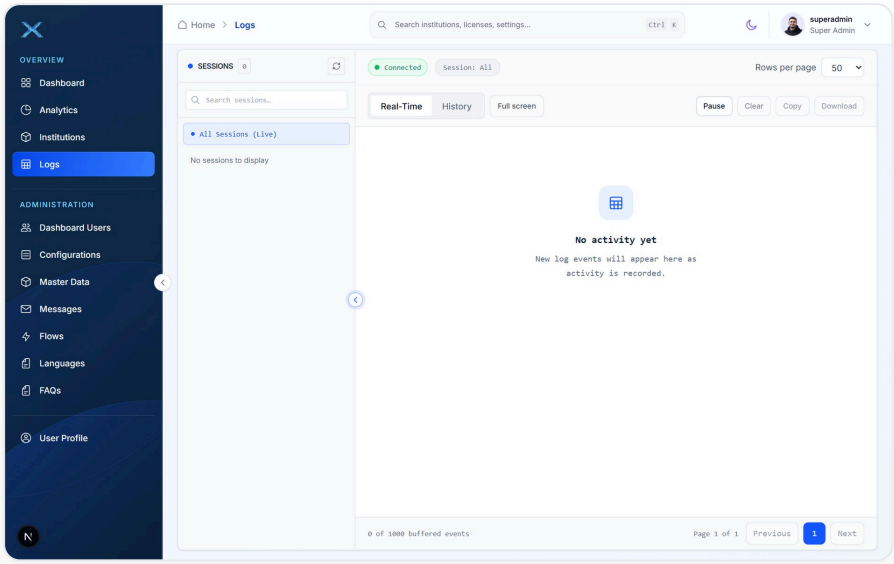

Figure 14. Logs.

5.3 Dashboard Users

Create and manage the accounts that can sign in to this dashboard. Cards count Super Admins, Managers and Viewers. Search by name, email or role, filter by role, and use **New User** to add an account.

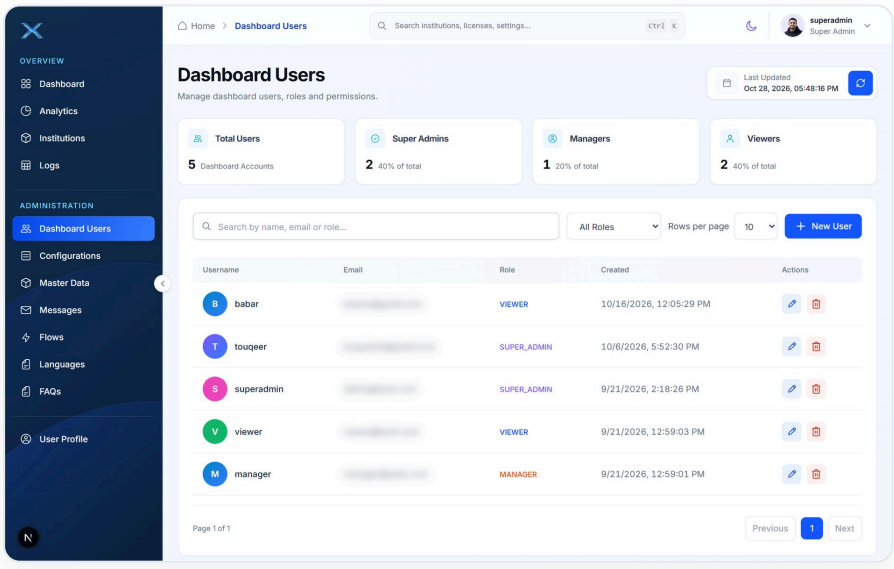

Figure 15. Dashboard Users.

5.4 Configurations

Adjust how the assistant behaves. Settings are numeric or on/off and can be filtered by type. Changes apply as soon as they are saved, so edit with care.

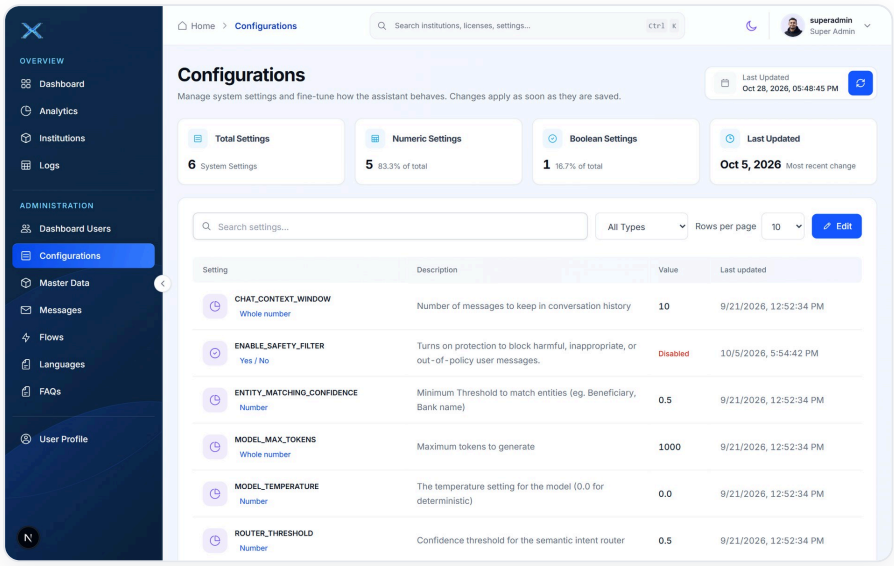

Figure 16. Configurations.

5.5 Master Data

Maintain reference data in six tabs: Banks Billers Donations Cards Biller Types Biller Categories Each tab lists its records with an active flag and offers add, edit and delete.

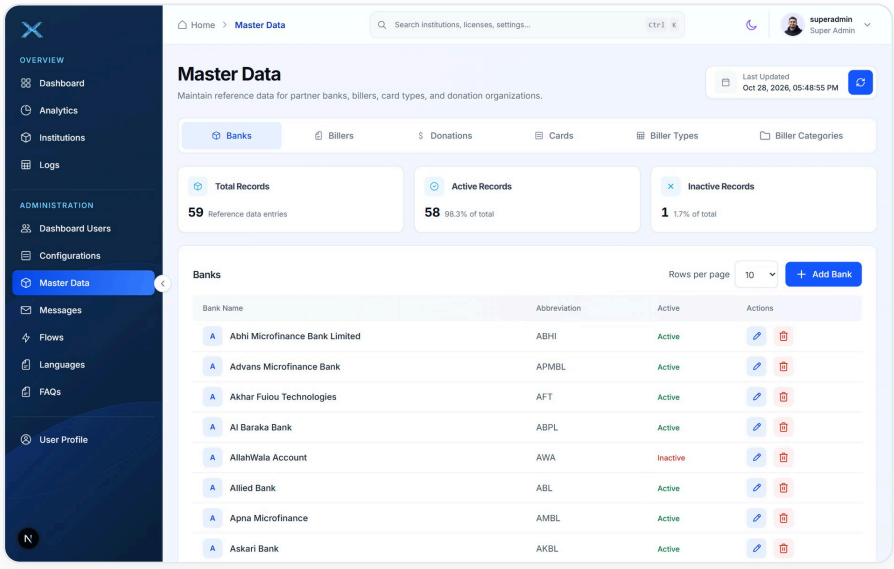

Figure 17. Master Data.

5.6 Messages

Review and customise the automated voice and chat message templates across all supported languages. Each row shows the message key, its parameters, language, text and status.

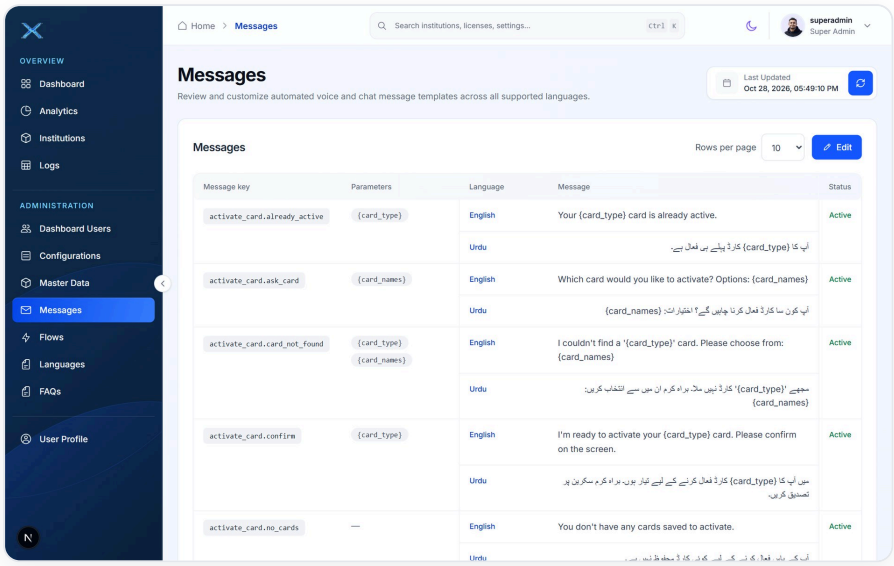

Figure 18. Messages.

5.7 Flows

Enable or disable conversational banking task flows. Each row is an intent with an **Enabled** switch; a disabled flow is no longer offered to customers.

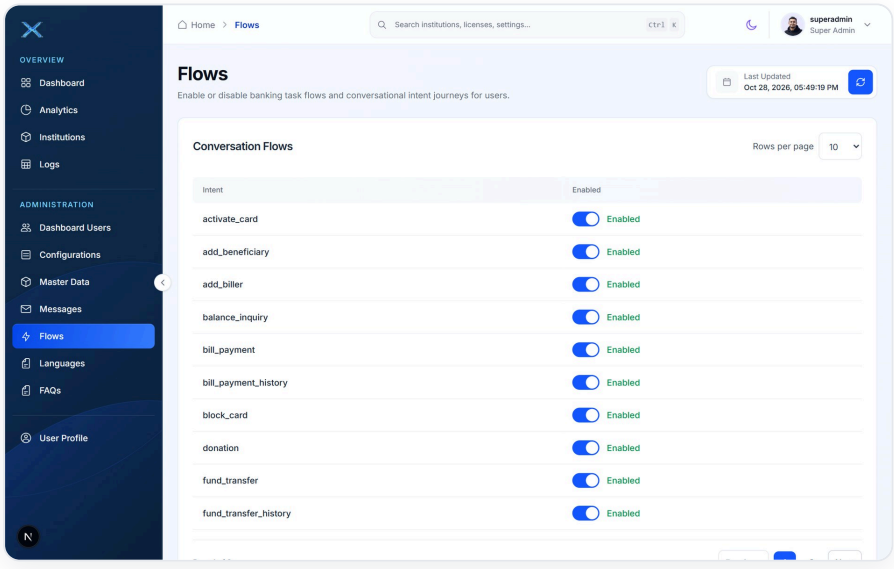

Figure 19. Flows.

5.8 Languages

Configure the languages the assistant supports and choose the **primary** language used by default. Add a language with **New Language**, and enable or disable existing ones.

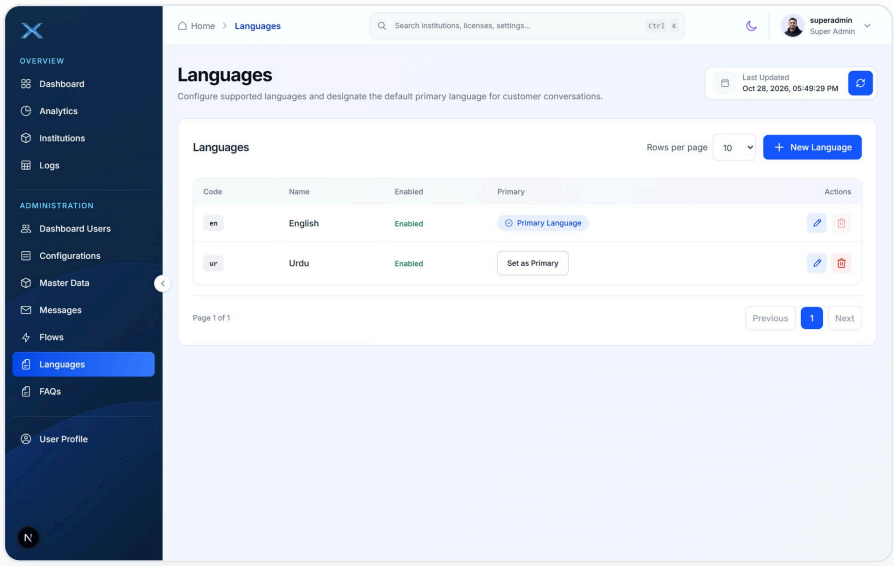

Figure 20. Languages.

5.9 FAQs

Keep customer support content up to date. Set the FAQ page header and introduction, organise questions into sections, and use **Add FAQ** to write a new question and answer. Filter by status to see drafts or published items.

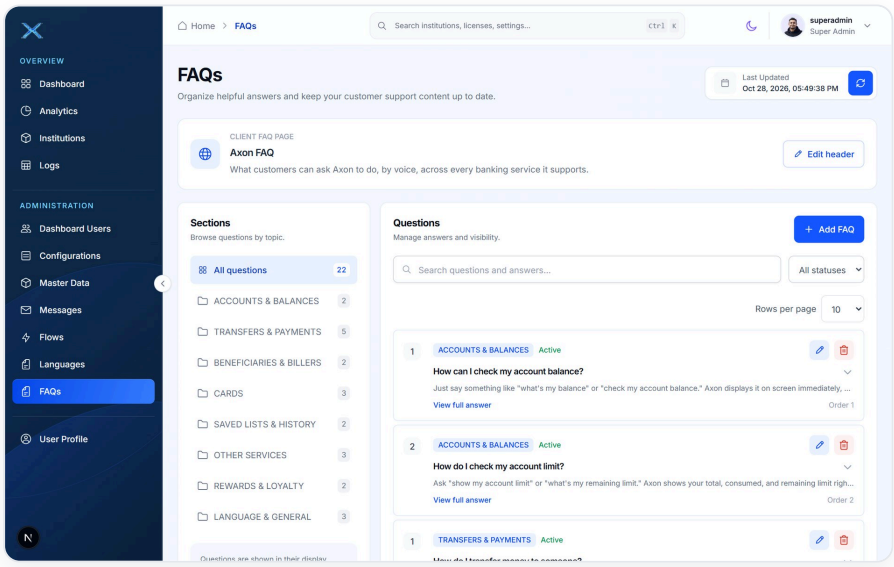

Figure 21. FAQs.

5.10 User Profile

View your administrator identity, active credentials and assigned dashboard permissions. Open it from the sidebar or from your account menu.

6 How do I...?

Short, step-by-step answers to the tasks administrators do most. Nothing is saved until you select the final button, and you can close any dialog with the × or `Esc`.

Before you start You need an account with permission to manage the area. If a button is missing, ask a Super Admin to review your role.

6.1 Add an institution

1. Open **Institutions** from the sidebar.
2. Choose **New Institution** at the top right of *Manage Institutions*.
3. Enter the **Institution Name** and pick the **License Expires At** date and time.
4. Select **Create Institution**.

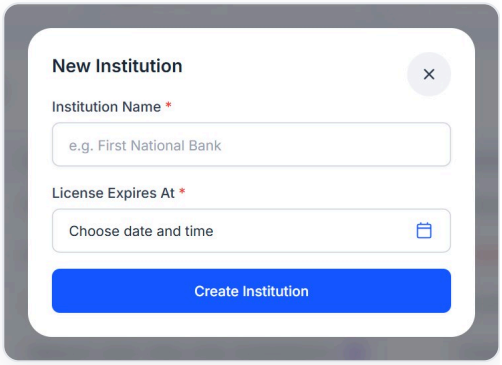

Figure 23. Add an institution.

GOOD TO KNOW

The institution appears in the list with its license expiry and status. Use the icons in its **Actions** column to edit it or manage its license later.

6.2 Add a dashboard user

1. Open **Dashboard Users**.
2. Choose **New User**.
3. Enter the **Username** and **Email**, and choose the **Role**.
4. Select **Create User**.

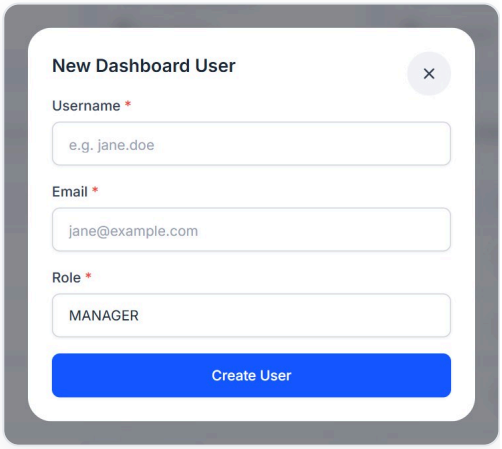

Figure 24. Add a dashboard user.

GOOD TO KNOW

Roles control what the person can do: Super Admin, Manager or Viewer. Choose the lowest role that fits their job.

6.3 Add a language

1. Open **Languages**.
2. Choose **New Language** and pick the language from the list.
3. Leave **Enabled** on so customers can use it.
4. Select **Create Language**.

> **GOOD TO KNOW**
>
> To make it the default, use **Set as Primary** on its row. Only one language is primary at a time.

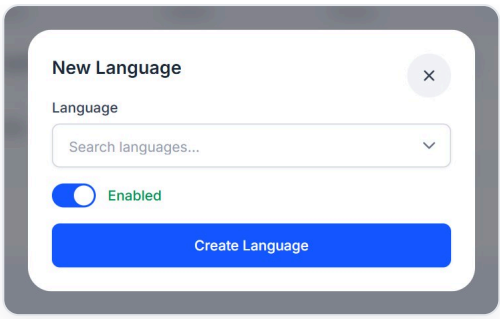

Figure 25. Add a language.

6.4 Add an FAQ

1. Open **FAQs** and choose **Add FAQ**.
2. Type a **Section title**, or choose an existing section.
3. Write the **Question** and the **Answer**.
4. Optionally open **Display order** to place it, and keep **Active** on to show it on the customer FAQ page.
5. Select **Save FAQ**.

> **GOOD TO KNOW**
>
> Write answers the way a customer would ask the question. Short, direct answers work best.

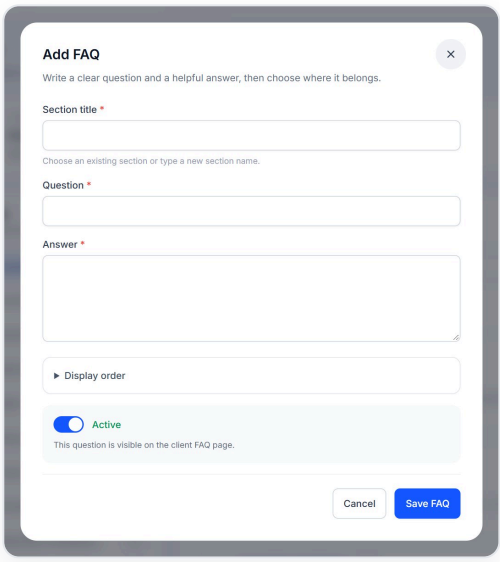

Figure 26. Add an FAQ.

6.5 Add a bank (or other reference data)

1. Open **Master Data** and choose the **Banks** tab.
2. Choose **Add Bank**.
3. Enter the **Bank Name** and **Abbreviation**, and keep **Active** on.
4. Select **Save**.

> **GOOD TO KNOW**
>
> Billers, donations, card types, biller types and biller categories follow the same pattern on their own tabs.

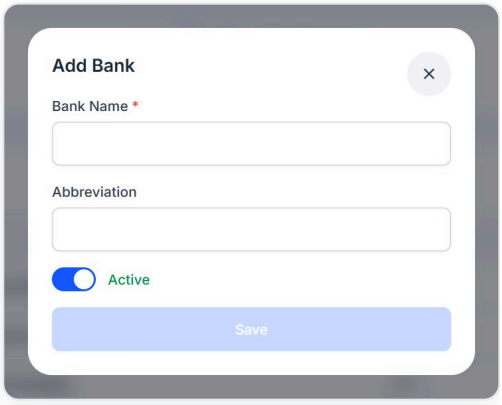

Figure 27. Add a bank (or other reference data).

6.6 Change a configuration setting

1. Open **Configurations**.
2. Choose **Edit** above the list. The values become editable.
3. Change a **Value**. The allowed range is shown beneath the field.
4. Select **Save** on that row, then **Cancel editing** when you are done.

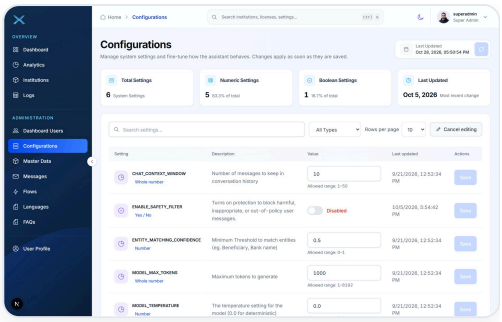

Figure 28. Change a configuration setting.

> **GOOD TO KNOW**
>
> Changes apply as soon as they are saved, and they affect how the assistant behaves for every customer. Change one setting at a time and note the original value.

7 Reference

7.1 Reporting periods and comparisons

Each period is compared with the window of equal length immediately before it. The comparison wording appears next to every badge.

Period	Window analysed	Compared with
Today	From midnight (UTC) to now	Yesterday
Yesterday	The full previous day	The day before
Last 7 days	Rolling 7 days	The prior 7 days (*vs last week*)
Last 14 days	Rolling 14 days	The prior 14 days
Last 30 days	Rolling 30 days	The prior 30 days (*vs last month*)
All time	Cumulative data	A prior 30-day baseline
Custom	Your start and end dates (inclusive)	An equal window immediately before

7.2 Glossary

Term	Meaning
Session	One conversation a customer starts with the assistant.
Turn	One question from the customer and the assistant's reply.
DAU / WAU / MAU	Distinct users active in a day, a rolling 7 days and a rolling 30 days.
Stickiness	DAU divided by MAU: how often monthly users return on a given day.
Retention	The share of users who came back for more than one session.
Journey / Flow	A multi-step banking task, such as a fund transfer or bill payment.
Abandonment	A started journey that the customer left unfinished.
Intent	What the customer is trying to do, as recognised by the assistant.
Confidence	How sure the assistant was when it recognised the intent.
Fallback	A request handed to the generative AI model because no standard flow fitted.
Latency	The time from the customer's message to the assistant's reply, in milliseconds.

Token	A unit of text processed by the language model; usage drives cost.

7.3 Troubleshooting

Symptom	What to try
Cards show no data, or a loading error	Check your connection, then refresh with the blue button. If you are returned to the sign-in page, your session has expired: sign in again.
A card reads No Data	Nothing was recorded in the selected period. Widen the period, for example to Last 30 days.
A figure differs from the previous page	Pages may use different reporting periods. Check the period selector on each page.
An ⓘ shows general text only	The API sent no specific explanation for that card, so a built-in description is shown instead.
Live Logs show "Reconnecting…"	The live connection is re-establishing. If it persists, refresh the page or contact your administrator.
A page or action is missing	Your role may not include it. Ask a Super Admin to review your permissions.

7.4 Data sources

The dashboard reads from the Axon Admin API. Analytics pages use these endpoints, each accepting a `period` and, for custom ranges, `start_date` and `end_date`:

Endpoint	Used by
`/dashboard-analytics/overview`	Dashboard
`/dashboard-analytics/user-summary`	Audience
`/dashboard-analytics/chat-summary`	Conversations
`/dashboard-analytics/flow-summary`	Journeys
`/dashboard-analytics/nlp-summary`	AI Quality
`/dashboard-analytics/performance-summary`	Performance
`/dashboard-analytics/log-summary`	Activity Logs
